
Example 8: Variance estimates for Percentages: Men and Women. Variance estimates in SAS, SUDAAN, STATA, and WesVar Percentage of Males and Females Who Strongly Agree that “a young couple should not live together unless they are married” by Sex and Age

Following are the programs and output for an analysis of the percentage of all males and females interviewed in Cycle 6 of the NSFG who strongly agree with the statement that “a young couple should not live together unless they are married.” A cross-tabulation of strongly agreeing by sex and age was generated by SAS 9.1, SUDAAN 8.0.2, STATA 8.0, and WesVar 4.1. The estimates calculated are equivalent across software. However, due to the specific methods used in calculations, standard errors vary slightly across packages and design effects will vary more substantially.

SAS data files were converted to STATA 8.0 and SPSS formats using DBMS/COPY 8.0. Variables in upper case are original NSFG Cycle 6 variables or recodes. Variables in lower case represent variables that were recoded as part of the variance estimation program. Library and file names are generic and it is assumed the user will apply names specific to his or her computing environment. Formatting and library options have been deleted; preferences will vary across user organizations.

SAS 9.1

The DATA and SET steps create a dataset which contains the variables for males and females to be used in the analysis: strongly agreeing that couples should not live together unless they are married (‘okcohabx’) and age in three categories (‘agerx’: 15-24, 25-34, and 35-44).

The PROC SURVEYFREQ produces a cross-tabulation of unweighted and weighted cell counts for the variables (i.e. sex, agerx, and okcohabx) specified in the TABLE statement. The WEIGHT statement identifies the weight variable (FINALWGT) to be used in estimating the weighted frequency. PROC SURVEYFREQ calculates standard errors appropriate to the complex sample design identified by the STRATUM and CLUSTER statements. The specification of ROW in the TABLE statement limits the cell counts and percentages to the row, and DEFF requests calculation of the design effects for the row percentages.

SAS 9.1 Program

```

data NSFG.EX8F (keep=CASEID FEMALE OKCOHAB okcohabx AGER agerx SEST SECU SECU_R FINALWGT);
set NSFG.FEMALES;
if OKCOHAB=1 then okcohabx=1; else okcohabx=2;
if 15 le AGER le 24 then agerx=1;
if 25 le AGER le 34 then agerx=2;
if AGER ge 35 then agerx=3;
SECU=SECU_R;

data NSFG.EX8M (keep=CASEID FEMALE OKCOHAB okcohabx AGER agerx SEST SECU FINALWGT);
set NSFG.MALES;
if OKCOHAB=1 then okcohabx=1; else okcohabx=2;
if 15 le AGER le 24 then agerx=1;
if 25 le AGER le 34 then agerx=2;
if AGER ge 35 then agerx=3;
run;

proc sort data= NSFG.EX8M; by CASEID;
proc sort data= NSFG.EX8F; by CASEID;
data NSFG.EX8TOT;
merge NSFG.EX8M NSFG.EX8F; by CASEID;
proc surveyfreq data= NSFG.EX8TOT;
stratum SEST;
cluster SECU;
weight FINALWGT;
table agerx*okcohabx / row deff;
proc surveyfreq data= NSFG.EX8TOT;
stratum SEST;
cluster SECU;
weight FINALWGT;
table EMALE*agerx*okcohabx / row deff;
run;

```

Design effects are greater than 1.0 for all row proportions due to clustering in the selection and an increase in variance due to weighting. The estimated proportions are equivalent to the other software systems.

SUDAAN 8.0.2

A SAS-callable version of SUDAAN 8.0.2 was used to calculate the estimates for this example. The DATA and SET steps used to create a dataset and the variables needed for this analysis ('agerx' and 'okcohabx') are identical to those used above in the SAS 9.1 program, and are omitted for this program.

The PROC CROSSTAB procedure produces a frequency cross-tabulation of unweighted and weighted cell counts for the analysis variables (i.e. FEMALE, 'agerx', and 'okcohabx') specified in the TABLE statement. The DESIGN used in this computation is

specified as WR, with replacement. By specifying the option DEFF in the CROSSTAB statement, design effects will be calculated. The NEST statement specifies the strata (SEST) and cluster (SECU) variables for calculating standard errors appropriate to the complex sample design. The WEIGHT statement identifies FINALWGT for use in estimating the weighted frequency. The specification of NSUM, WSUM, ROWPER, SEROW, and DEFFROW in the PRINT statement limits printed output to those row percentages, standard errors of row percentages, and design effects for row percentages.

SUDAAN 8.0.2 Program

```
(same recode and merge as required in SAS 9.1)

proc sort data=NSFG.EX8TOT;
by SEST SECU;
proc crosstab data=NSFG.EX8TOT design=wr deff;
nest SEST SECU;
weight FINALWGT;
subgroup FEMALE agerx okcohax;
levels 2, 3 , 2;
tables FEMALE*agerx*okcohax;
print nsum wsum rowper serow deffrow;
run;
```

The estimated percentages of men and women strongly agreeing that “a young couple should not live together unless they are married” by age are identical to those calculated by SAS 9.1:

STATA 8.0

The *use* statement specifies the dataset to be used. The *svyset* command specifies the weight (FINALWGT), strata (SEST), and cluster (SECU) variables to be used in by STATA 8.0 in estimation. The settings are saved for the current session, but can be cleared by entering the *clear* command or running *svyset* again with different settings.

The *generate* and *replace* statements create the recodes 'agerx', 'femalex', 'male', and 'okcohabx'. The first *svytab* command produces a cross-tabulation of 'agerx' and 'okcohabx' for females; the second *svytab* command produces a cross-tabulation of 'agerx' and 'okcohabx' for males. The *svytab* command provides estimates appropriate to the complex sample design identified by the *svyset* command. Two *svytab* commands with subpopulation specifications are needed because STATA only produces two-way cross-tabulations. The requested estimates and output are limited by specifying *row*, *deff*, and *se* after the *svytab* command.

35-44	10.75 (.8595) 12.41	89.25 (.8595) 2.126	100
Total	9.695 (.5859) 2.472	90.3 (.5859) 2.472	100

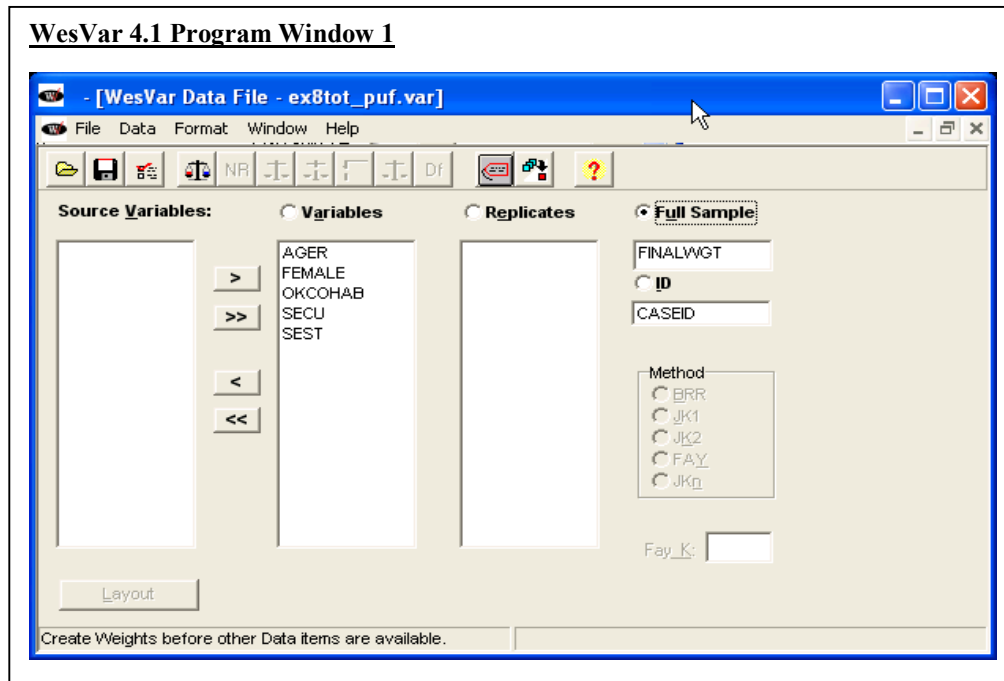

Key: row percentages
(standard errors of row percentages)
deff for variances of row percentages

```
Pearson:
Uncorrected chi2(2) = 9.2382
Design-based F(1.77, 148.74) = 1.3524 P = 0.2608
Mean generalized deff = 3.3737
CV of generalized deffs = 0.3792
```

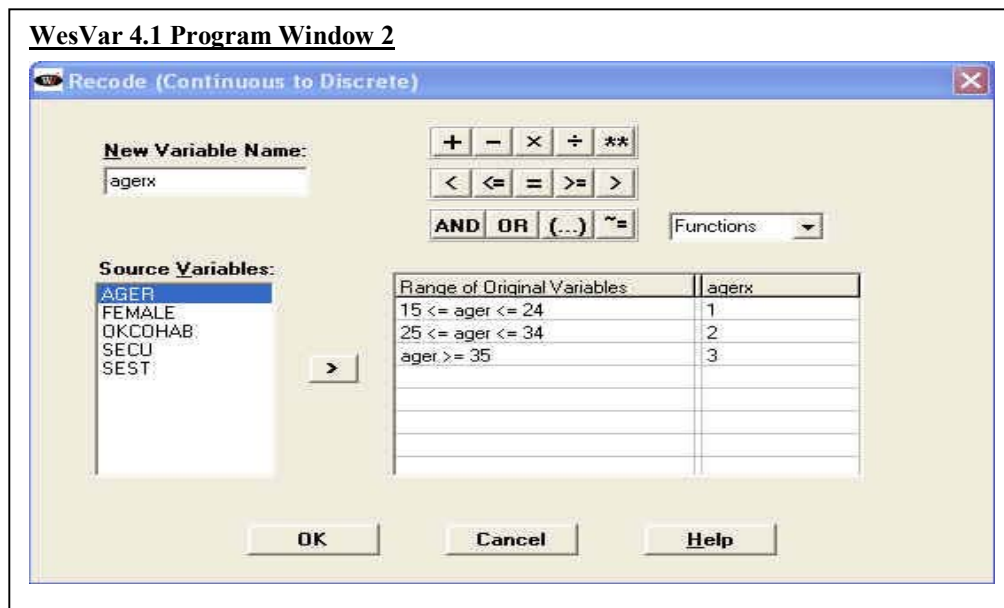

WesVar 4.1

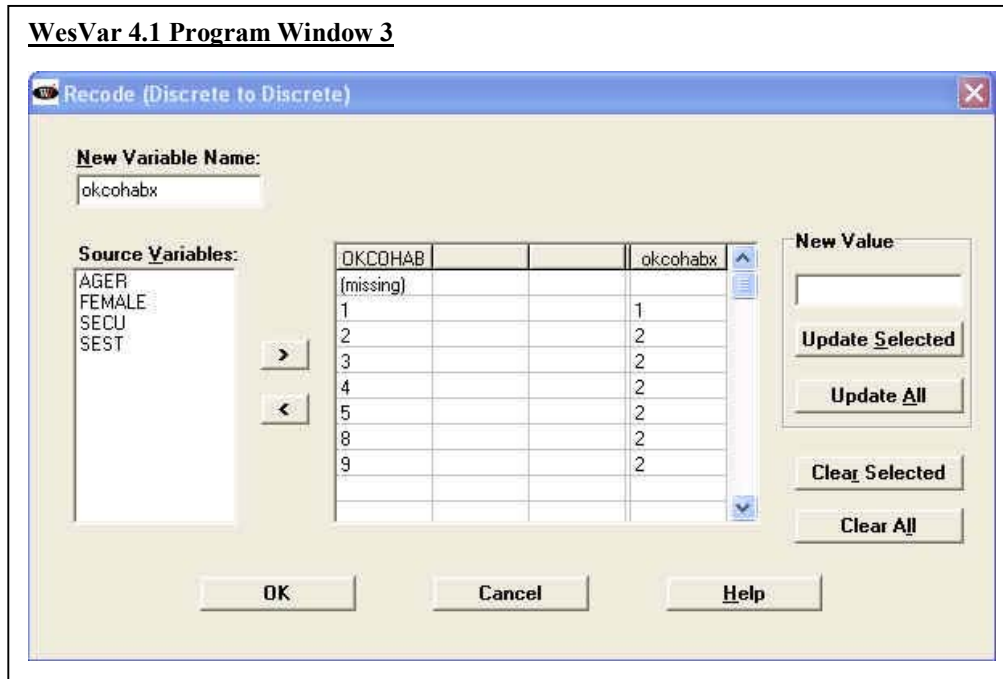

Not all WesVar windows are displayed for this example. Readers may refer to Example 1 for a full set of windows. An SPSS file was imported for use in analysis.

Window 1 displays the selection and categorization of variables to be used in the current analysis. After variables are selected and categorized, a new dataset is created.

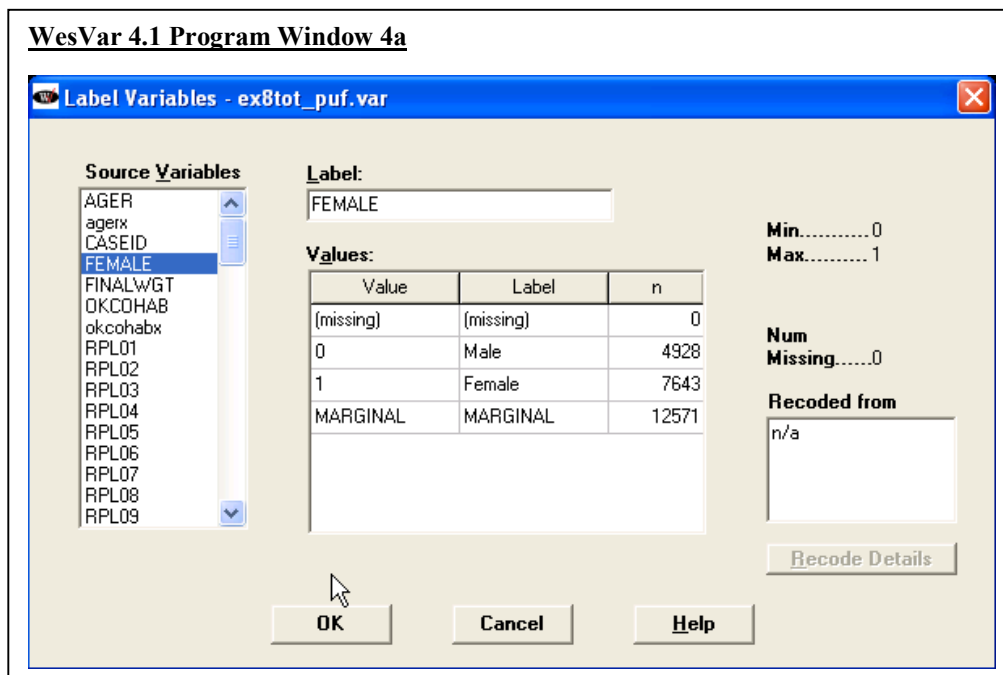

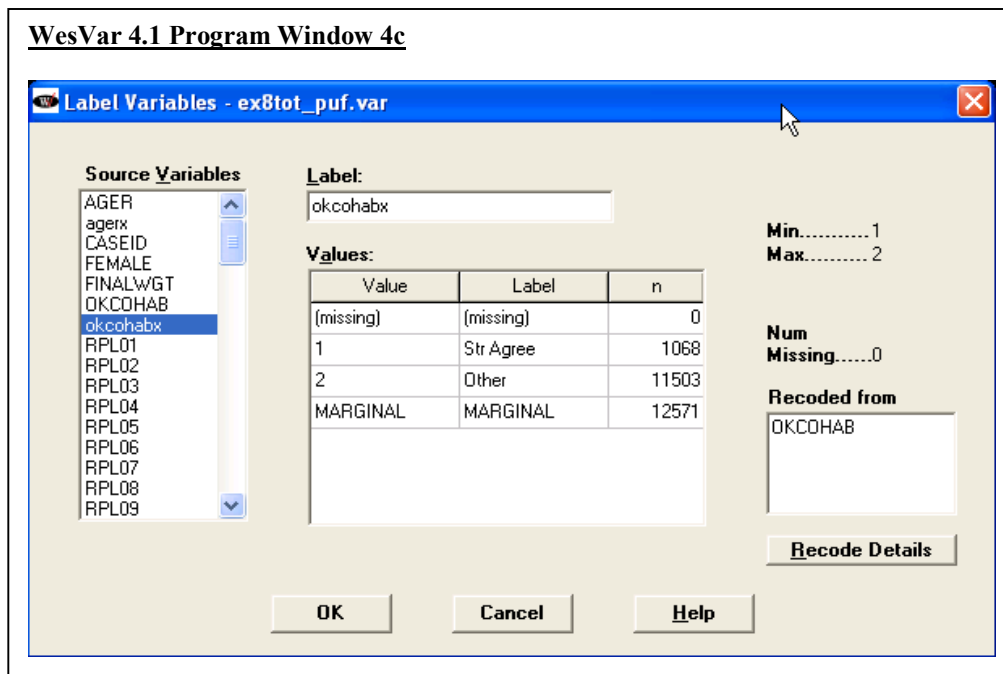

Windows 2 and 3 display the procedures for recoding AGER into *agerx* and OKCOHAB into 'okcohabx'. To create 'agerx' from AGER, select Recode under the *Format* menu and then the *New Continuous to Discrete* button; to create 'okcohabx' from OKCOHAB, select the *New Discrete to Discrete* button. After the recodes were created, a new dataset is saved.

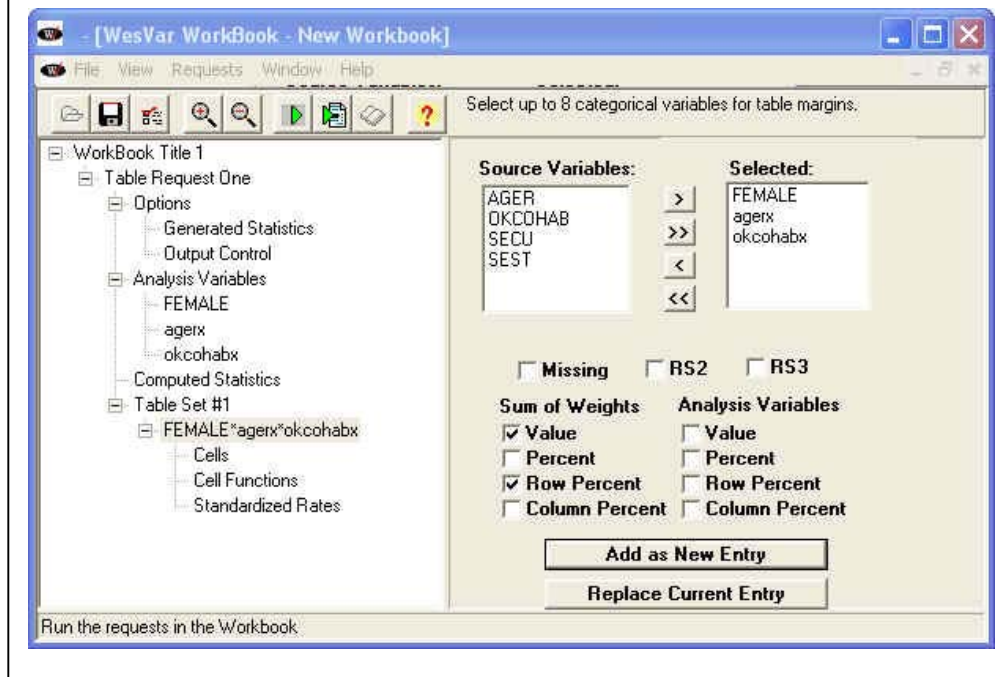

Windows 4a-4c display how the value labels were applied to FEMALE, 'agerx', and 'okcohabx'.

In Window 5 select the variables for analysis for a table estimating the percentage of males and females who strongly agree that “a young couple should not live together until they are married”, by age.

WesVar 4.1 Program Window 5

The output provided by WesVar 4.1 is a list-wise statement of all estimates requested. The estimates of the percentages are identical to those produced by SAS 9.1, SUDAAN 8.0.2, and STATA 8.0, as expected.
